

TeslaDash Master V2.2

User Manual (English)

1. Introduction

TeslaDash Master V2.2 is a high-end dashcam management and analysis tool specifically designed for Tesla owners. The system automatically decodes embedded telemetry data to provide synchronized multi-cam playback, GPS tracking, and real-time G-force/pedal visualization.

2. Getting Started

Open Folder

Click **[Open Folder]** and select the TeslaCam directory from your USB drive. The app will organize all clips chronologically.

Adding Clips

Use the **[Add]** button to combine clips from different dates or folders into your current session.

3. Advanced Caching & Performance

Asynchronous Lazy Loading

V2.2 features background processing. When loading large amounts of data, the UI remains responsive. Telemetry analysis happens in the background and generates encrypted cache files, making subsequent visits to the same folder nearly instantaneous.

4. Event Detection & Filtering

The playlist now automatically tags key moments. Use the **[Clip Filters]** panel at the bottom to find events quickly:

-  **Sentry Awareness:** Object detection triggered.
-  **Handle Pulled:** Someone attempted to pull the door handle while locked.
-  **Sentry Shock:** Physical vibration detected (includes G-force value).
-  **Honk:** Manual clip saved by honking.
-  **Dashcam Icon:** Manual clip saved via screen tap.
-  **Collision:** Potential impact or emergency event.
-  **AEB Triggered:** Automatic Emergency Braking activation.
-  **Hard Brake:** Detected via telemetry (Brake applied > 80%).
-  **High G-Force:** Detected during sharp turns or severe shaking.

5. Director Mode

To create professional edits from multiple angles, enable **[Manual Director Mode]**:

- Double-click any sub-camera (or click the ↗ icon) during playback to record a "shot switch."
- During export, the video will automatically cut between cameras according to your recorded script.

6. Dashboard & HUD

V2.2 features a factory-grade visual overhaul:

- **T-Style Steering:** Thick Bezier-curve design that accurately mirrors steering wheel angles.
- **Metal Pedals:** Real-time visualization of accelerator and brake inputs with anti-slip textures.
- **GPS Map:** Integrated OpenStreetMap depicting your driving path and current coordinates.

7. Exporting & GPX

- **Video Export:** Set [Start] and [End] markers, choose an encoder, and export. Support for 9:16 Vertical Shorts is available.
- **GPX Export:** Save your driving path as a standard GPX file, compatible with Google Maps and other GIS software.
