

TeslaDash Master V2.3

Advanced Dashcam Management & Analysis | User Manual

1. Introduction

TeslaDash Master V2.3 is an advanced dashcam management and analysis software designed specifically for Tesla owners. This system automatically parses embedded telemetry data from Tesla dashcam footage, offering commercial-grade features such as multi-camera synchronized playback, dynamic GPS tracking, and real-time G-force & pedal dynamics displays.

2. Quick Start

Open Folder

Click **[Open Folder]** in the bottom left corner and select the TeslaCam folder on your USB drive. The system will automatically scan all subfolders and generate a smart playlist.

Add Videos

To view clips from different dates, use the **[Add]** button to load other folders into the current playlist. The system will automatically sort them chronologically.

3. Core Features & V2.3 Highlights

Commercial-Grade Map Gallery [New in V2.3]

A new "Map Gallery" tab has been added to the right panel, providing a **God's eye view** of all your event footprints. Click a pin on the map to **seamlessly switch** to the corresponding video. Map pins sync perfectly with the event filter.

Extreme Performance Boost [New in V2.3]

With the introduction of debounce schedulers and single-folder caching mechanisms, loading even a **massive 1TB USB drive** is now lightning-fast, offering instant playlist rendering and smooth map loading without freezing.

Asynchronous Smart Parsing (Lazy Loading)

When loading videos, the software silently parses map and telemetry data in the background. Encrypted cache files are generated upon completion, ensuring a "zero-delay" instant open experience the next time you access the same path.

4. Event Detection & Filtering

The playlist automatically annotates key events. You can quickly filter for specific incidents using the **[Video Filter]** below the playlist:

-  **Sentry:** Object proximity detected.
-  **Handle Pulled:** Attempt to open the door while locked.
-  **Shock:** Physical vibration detected (combined with precise G-force calculation).
-  **Honk** /  **Dashcam Tapped:** Manual save triggered by the driver.
-  **Crash** /  **AEB Triggered:** Potential collision or Auto Emergency Braking intervention detected.
-  **Hard Brake (>80%)** /  **High G-Force:** High-risk dynamics autonomously detected via telemetry big data analysis.

5. Director Mode

If you wish to edit the four camera angles into a single highlight reel, check **[Enable Director Mode]**:

During playback, **double-click** any sub-camera (or click the toggle button in its top-right corner). The system will record the exact switch time and the current sub-camera zoom states. Upon

export, the final video will automatically switch camera angles seamlessly based on your manual inputs.

6. Dashboard & HUD

V2.3 features a factory-grade visual overhaul, overlaying professional telemetry onto your videos:

- **T-Style Steering Wheel:** Features premium Bezier curves, accurately reflecting real-time steering angles.
- **Metallic Pedals:** Displays real-time accelerator and brake pedal depth with 3D anti-slip textures.
- **G-Force Meter:** Highly sensitive real-time calculation of dynamic X/Y axis centrifugal forces and G-values.

7. Export & GPX

Video Export

Set your [ **Start**] and [ **End**] points on the timeline, select a hardware-accelerated encoder, and click export. V2.3 supports **vertical 9:16** exports, perfect for sharing on social media.

GPX Track Export

Export standard GPS track files with a single click. These files can be imported directly into Google Maps or professional mapping software to review your entire journey's path and speed variations.
