

TeslaDash Master

The Ultimate Tesla Dashcam Post-Processing Tool V2.0

Welcome to **TeslaDash Master V2.0**. This software is designed exclusively for Tesla owners to transform scattered Sentry and Dashcam clips into professional videos featuring advanced HUD dashboards, telemetry overlays, and intelligent editing. Whether for reporting violations, sharing on social media, or keeping as a memory, this is your most powerful assistant.

I. Key Features

Immersive HUD Dashboard

Real-time analysis of embedded telemetry data to recreate vehicle dynamics:

- **G-Force Meter:** Realistic simulation of physical inertia during braking and steering, with precise value displays.
- **Dynamic Pedals:** Integrated with G-force logic to accurately simulate braking depth and accelerator pressure.
- **Vehicle Stats:** Includes speed, gear, steering angle, blinkers, heading, and coordinates.
- **Glass UI:** High-quality semi-transparent black overlays that remain clear against any background.

Cross-Platform Layout Support (Vertical/Horizontal)

- **Horizontal Layout:** Classic 4:3 arrangement, ideal for YouTube and accident analysis.
- **Vertical Shorts (9:16):** Optimized for IG Reels, TikTok, and YouTube Shorts.

- **Smart Grid:** Automatically detects and adapts to HW3 (4 cameras) and HW4 (6 cameras) configurations.

GPS Tracking & Map Integration

- **Real-time Map Overlay:** Automatically draws the driving path in the corner with a red navigation arrow.
- **GPX Export:** Merges and exports entire journeys into standard GPX format for Google My Maps.
- **Smart Cache:** Automatically generates telemetry caches protected by SHA-256 signatures, increasing analysis speed by 10x.

Director Mode

- **Manual Switching:** Double-click any sub-camera during playback to record a custom storyboard.
- **Auto-Reverse Detection:** Automatically switches to the rear camera in Reverse and back to Front in Drive.
- **Smart Event Markers:** Timeline automatically marks "Sentry", "Honk", and "Hard Brake" events for easy navigation.

II. System Requirements

Item	Requirement
OS	Windows 10 / 11 (64-bit Only)
CPU	Intel Core i5 / AMD Ryzen 5 or higher
GPU	NVIDIA (NVENC) or AMD (AMF) recommended for hardware acceleration

III. Usage Workflow

- 1 Open Folder:** Click the button to auto-scan the TeslaCam folder on your USB drive.
- 2 Set Markers:** Select a clip, drag the slider, and click " Start" and " End".
- 3 Director Mode (Optional):** Double-click sub-cameras to set the main view or toggle Vertical mode.
- 4 Select Encoder:** Choose a hardware-accelerated encoder marked with "".
- 5 Start Export:** Click Export to process the storyboard, overlays, and merge into a single video.

IV. Important Notes

- **Telemetry Cache:** *-telemetry.csv files are generated in the video folder. Do not modify them, or the SHA-256 signature will fail.
- **FFmpeg Dependency:** Ensure ffmpeg.exe exists in the bin folder.
- **Old Software:** Vehicles with very old software may lack embedded telemetry; HUD and Map will be disabled.
- **Privacy:** GPX files contain precise coordinates and timestamps; share them with caution.
